

your house came with free upgrades;  
Formaldehyde, Benzene and Mycotoxins  
**....and construction debris hidden in your duct work!**

A damp house with high humidity may lead to increased levels of dust mites and mold leading to increased allergic respiratory symptoms, as well as the worsening of asthma. And even if someone is not allergic to molds it may produce mycotoxins and volatile organic chemical (VOC's) that smell bad and may cause respiratory irritation.

Indoor mold growth can be dead or alive and can be found on basement walls, around windows where moisture condenses and bathroom tiles.

New carpets and hardwood floors can produce VOC's (benzene and formaldehyde) these in combination with off gassing can create a toxic soup.

Our solution: bring FRESHAIR from outside.....remove TOXIC air from inside. Find out how our Greentek Home Ventilation systems with push through air flow can help solve your problems.
